

AUREON EXECUTIVE BRIEF

Pre-Trade Governance for AI-Assisted Investment Systems

Aureon is designed to sit between signal generation and execution infrastructure. Its role is to validate doctrine, risk, compliance, and human authority before a trade becomes a portfolio event.

WHAT IT IS

Governance Layer

Aureon is not a broker, OMS, or portfolio management replacement in this prototype. It is the control layer that makes AI-assisted decisions explainable, reviewable, and auditable before execution.

CORE OUTCOME

Decision Accountability

Every trade can be reconstructed as a lifecycle package: signal, doctrine check, risk review, compliance validation, human approval, execution, and settlement evidence.

WHY IT MATTERS

Smarter, Not Noisier

The product direction is to make financial systems more intelligent by structuring intent and governance, not by adding disconnected workflow complexity.

LIFECYCLE

How Aureon Works

1. Signal or Thesis Input

Market signal, portfolio drift, or future thesis-driven memo input.

2. Doctrine Validation

Rules, thresholds, and architecture-level governance are checked first.

3. Risk + Compliance Review

Risk boundaries and regulatory frameworks are evaluated visibly.

4. Human Authority

Material actions require explicit human approval and lineage stamping.

5. Execution + Replay

Execution, settlement, and audit artifacts become replayable records.

ARCHITECTURE

Four-Layer Governance Stack

Layer 0 - Verana

Network governance, vendor and counterparty boundaries, jurisdictional escalation, and system-wide control posture.

Layer 1 - Mentat

Doctrine interpretation, strategic intelligence, and policy logic that defines how the system should reason.

Layer 2 - Kaladan

AUDIENCE

Why It Resonates With Leadership

- **CTOs:** clear systems boundary between intelligence, control, and execution.
- **CIOs:** better governance around investment decisions before capital is deployed.
- **Chief Risk Managers:** visible pre-trade controls, replayability, and explainability.
- **Investors:** stronger trust model around how AI-assisted actions are governed.

Lifecycle orchestration across routing, treasury, settlement, and compliance artifacts.

Layer 3 - Thifur

Bounded execution agents that can recommend or perform actions within doctrine-defined authority.

POSITIONING

Commercial Framing

Aureon can be framed as a governance overlay above existing OMS infrastructure, a full-stack operating system for greenfield deployment, or a compliance intelligence layer that returns structured audit artifacts. The unifying theme is the same in every mode: governance before execution.
